Agile Backlog Creation & Sprint Simulation in Jira – Team 08, Digital Campus Library Reservation Gateway – Epic 4: Book Renewal (DCLRGM4)

1. Epic, User Story and Story Points

Epic	DCLRGM4-1 Book Renewal
Epic description	Allow members to renew borrowed books for one additional loan period when no other member has an active hold on the title.
User story	DCLRGM4-2 Renew Borrowed Book
As a / I want / So that	As a Student Member, I want to renew a borrowed book for one additional loan period, so that I can keep it longer when no other member is waiting for it.
Lab 1 requirement	FR-005 (Book renewal, blocked when an active hold exists)
Priority / Story points	Medium / 3 (Fibonacci)
Sprint goal	Allow members to renew a borrowed book for one additional loan period, as long as no other member has an active hold on the title.
Sprint outcome	1 story, 3 points committed; 1 of 1 story Done (100%)

Sprint Report

How to read this chart

Closed sprint, ended by kishankshenoy 01/Oct/26 8:52 AM - 05/Oct/26 8:55 AM View linked pages
Allow members to renew a borrowed book for one additional loan period, as long as no other member has an active hold on the title.

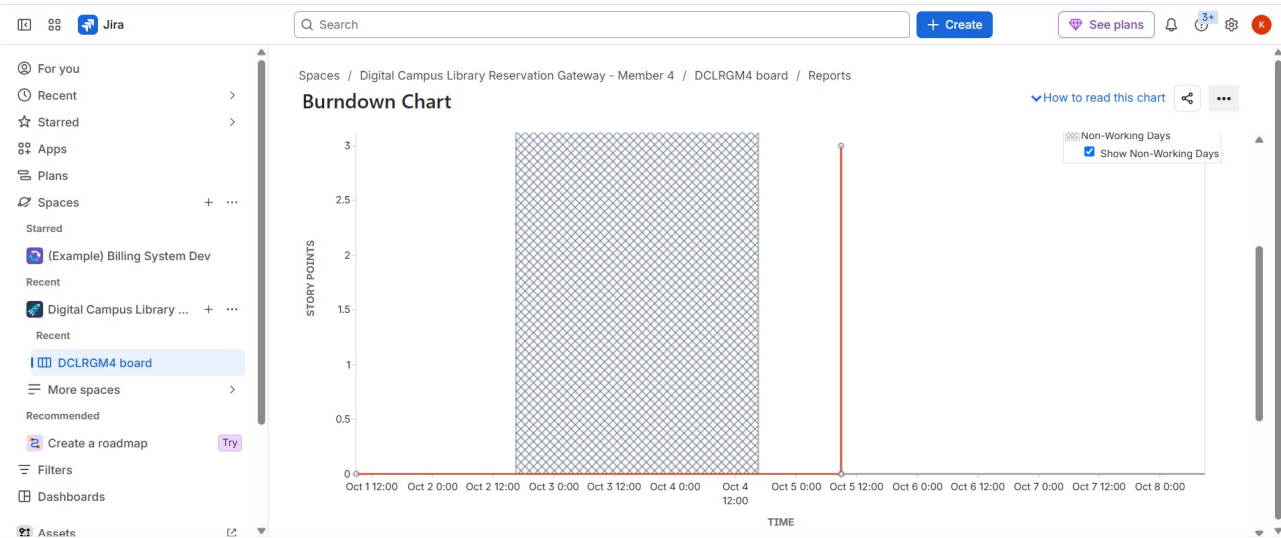

Status Report

* Issue added to sprint after start time

3. Burndown Chart

Figure 3.1: Burndown Chart – Sprint (Story Points)

Remaining story points fall from 3 to 0 as the committed story was completed.

4. Reflection Questions

1. Did your estimations reflect the actual effort?

Reasonably well. Renew Borrowed Book was sized at 3 story points, as a small, rule-based change: extend the due date by one standard loan period, show a confirmation, and block the renewal when another member has an active hold on the title. It needs no external integration and no new data structure, so it sits below larger stories such as placing a hold or notifying a member. Because this was a simulated sprint, the story was completed in a few minutes, so the estimate cannot be checked against real hours. As a team, Planning Poker would help confirm that 3 is the right size compared with the other stories.

2. Was your backlog well-prioritized?

Yes, for this epic. Book Renewal (and its single story) was given Medium priority. Renewal supports the core reservation flow rather than defining it, because the hold queue, notifications and fines are the central functions of the gateway. It is also tied to the hold queue, since a renewal must be refused when a hold exists, so it comes after the hold-related stories. With only one story in this epic, priority ordering inside the epic was not needed.

3. How did your simulated sprint align with your plan?

It aligned closely. The plan was a single sprint with one 3-point story and the goal of letting members renew a book when no hold exists. The story was planned into the sprint before it started, moved from To Do to In Progress to Done, and the sprint was then completed with 100% of the committed work finished. One detail: the sprint's start date was left at its default (1 Oct) instead of the actual run date (5 Oct), so Jira marks the story as added after the sprint start time in the Sprint Report. Setting the start date to the day the sprint actually begins would avoid that.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart drops straight from 3 story points to 0 instead of following the diagonal guideline. This happened because the work was simulated and the single story was moved to Done in one sitting, so the chart shows no gradual progress. It confirms that the committed 3 points were delivered in full, but one sprint with one small story is not enough data to measure real team velocity. In a real project, I would update the board daily across the one-week sprint, so the chart shows steady progress and can be used to plan capacity for the next sprint.
